Comment: This protein is homologous to the beta transforming growth factor, inhibin al hese sequences. All of these proteins are biologically active as disulfide-linked dimer (Comment: Although it does not compete with EGF for receptor binding sites, MIS can inhibin (Superfamily: inhibin)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Comment: This glycoprotein, produced by the Sertoli cells of the testis, tissues of Mullerian duct origin. Other roles for this protein in gonadal er duct regression and in the adult ovary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  n, K.L.; Ragin, R.C.; Manganaro, T.F.; MacLaughlin, D.T.; Donahoe, P.K. ell 45, 685-698, 1986

Activation by Wnt8 induces expression of beta-catenin
                                                                                                                                                                                                                                                                                                                                                                GSK-3 kinase, nuclear accumulation of beta-catenin and activation of Wnt target genes. A second signaling pathway involving PKC and calcium fluxes has been seen for some family members, but it is not yet clear if it represents a distinct pathway or if it can be integrated in the canonical pathway, as PKC seems to be required for Wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to involve interactions with G-proteins. May be involved in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                r. Biol. 9:695-698(1999).

FUNCTION: Receptor for Wnt proteins. Most of frizzled receptors are compled to the beta-catenin canonical signaling pathway, while the activation of dishevelled proteins, inhibition of leads to the activation of dishevelled proteins inhibition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              homologs of the Drosophila polarity gene frizzled (fz) are widely essed in mammalian tissues.";

uptake.

capalytic activity: NADH + 2 Fe(3+) = NAD(+) + 2 Fe(2+).

CCFACTOR: FAD (Probable).

SUBCELLULAR LOCATION: Integral membrane protein.

INDUCTION: BY IRON DEPRIVATION. REPRESSED BY IRON UPTAKE
SIMILARITY: Belongs to the FRE / CYBB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     European Bioinformatics Institute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          participate in the transport of electrons from cytoplasm to extracellular substrate (ferric ion) via FAD and heme intermediates. May also participate in Cu(II) reduction and

-!- SUBCELLULAR LOCATION: Integral membrane protein. Endoplamic reticulum and ER-Golgi intermediate compartment (ERGIC).

-!- PTM: Does not seem to be N-glycosylated.

-!- DISEASE: Defects in CLN8 are a cause of progressive epilepsy with mental retardation (EPMR) [MIM:600143]; also known as neuronal ceroid lipofuscinosis type 8 and Northern epilepsy. EPMR is an autosomal recessive disorder characterized by normal early development, onset of generalized seizures between 5 and 10 years,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.
